

## Specific targets of the Network 2024 - 2028

### Objective 1:

The PHE Network completes its transition to independence and is functioning as an independent network, with sufficient capacity and resources to sustain its operations and support its growth by 2027

### Objective 2:

A robust monitoring and evaluation system is operational, enabling the network to track its performance and gather evidence of impact, evaluate and refine its model, and develop tools to support replication of PHE approach

### Objective 3:

Number and quality of PHE partnerships across the country increased

### Objective 4:

National policy framework supporting an enabling environment for PHE adoption is in place

### Objective 5:

Continuous expansion in influence of the PHE Network nationally and globally

## What we do?

### *A platform for everyone to share and learn from each other*

The PHE approach is being implemented by numerous health and conservation organisations in Madagascar through win-win PHE partnerships that combine their already funded activities. To date, the Network has +70 partners members and is supporting +40 PHE partnerships.

### *We connect multiple partners and promote exchanges*

Through national and regional coordination meetings, forum discussion, sharing and training workshops, site learning exchange visits, we are enabling partners to know each other, strengthen coordination of interventions, harmonise interventions, connect and explore potential collaboration between them.

### *We aim to a large adoption of the PHE approach supporting a natural resource managed sustainably by a healthy and resilient communities*

The PHE approach seeks to address the interconnected challenges between population, health and the environment through integrated, holistic strategies: enabling couples to plan and better provide for their families, improve their well-being, diversify their livelihoods and empower them to manage their natural resources sustainably.

## How we work?

The most effective PHE partnerships are formed by cross-training staff, developing joint work plans and using integrated community outreach materials. In general, the PHE network is focusing on:

- Listening to our *network member*
- Providing a *forum for training and exchanging learning / best practices*
- Constantly *looking to innovative model*
- Focusing on *partner technical support*
- Supporting according to *partners' needs*
- Scaling *best model*
- *Documenting experiences* at different level
- Sharing *diverse opportunities*

## How we support our members?

- Identify *partners needs*
- Facilitate *connection*
- Through *partner gathering*
- *Bring experiences* from the field across learning exchange visits
- Strengthening *their capacity*
- Provide *technical supports*
- Produce and disseminate *outreach tools*
- Boost their *visibility*
- Sharing *opportunities* (funding, training, conference, recruitment)

## About us!

### Join us in the Madagascar Population Health Environment Network

The Madagascar PHE Network is a national learning network established in 2014 with the purpose of bringing together health and conservation organizations, as well as relevant ministries to support the adoption of PHE partnerships. The network supports these actors to implement cross-sectoral initiatives that improve the health of both people and the environment.

## Our Vision

“Healthy and resilient communities living in a healthy environment with sustainable livelihoods”

## Areas of focus

## General objective of the Network

The PHE Network aims to connect and inspire conservation and health actors; using best practice model enabling the development of high quality PHE partnerships, reaching all communities living in or adjacent to Madagascar's priority areas of high biodiversity, has robust data on impact, is leading a global movement on PHE and is supporting the long term sustainability of this approach.

## Our Values

## Our Mission

The Madagascar PHE Network connects, inspires and supports its members leading the PHE approach as the default model for conservation programming in Madagascar

*Poor community health, unmet family planning needs, food insecurity, environmental degradation and vulnerability to climate change all interact and compound each other in increasingly negative ways..*

*The PHE approach recognizes the interconnections between population dynamics, health, and the environment.*
